

HEKO components type TS and SMO for Deasher

The Company

HEKO manufacture:

- Round link chains with high resistance to wear
- Shackles for attaching scrapers and other components
- · Chain wheels
- Central chains
- Heat resistance chain for rotary and other kilns
- · Forge link chains
- Bushed chains

HEKO is one of the world's leading producers of chains and other wear resistant parts for the bulk handling industry. Innovation and high quality standards have been quintessential to our family business for over 100 years. Two locations in the state of North Rhine Westphalia, Germany with a production area of approximately 40.000 m², provide for the manufacture of a large variety of chains, chain wheels, chain accessories and unit assembly for conveyors.

HEKO are the market leaders for heat resistant kiln chains as well as being one of the leading manufacturers of hardened round link chains. The extensive know-how in hardening techniques and up-to-date heat treatment technology is also

offered as a separate service. We supply the world wide bulk solids handling industry in all areas of operation. HEKO not only supplies the cement and lime industry but also has an extensive market share in waste incineration, coal fired power stations, wood and other types of bio-fuel power stations, ore and mineral preparation, fertilizer manufacture, gypsum manufacture and concrete plants.

HEKO has a sales organisation in India and a sales office in China and has agents in over 50 countries. The efficiency of HEKO's chains is confirmed daily in over 80 countries around the world.

All HEKO employees fully accept their responsibility for the quality of their work.

HEKO's quality management is actively pursued by all and HEKO is certified to ISO 9001.

HEKO also hold the environmental certificates to ISO 14001, health and safety certificates to OHSAS 18001, custom certificate AEO-F and LBA certificate.

HEKO - Your partner for conveying

Chain manufacture

HEKO's chains are manufactured using the most up-to-date welding machines. Maganese, Chrome-Nickle and fine grained Chrome-Nickle-Molybdenium alloy steel are used in the chain manufacture. The chains are case hardened in modern, computer controlled heat treatment facilities.

Important characteristics of HEKO chains are:

- Heat treatments selected to suit the requirement of the application
- High long term dynamic strength
- Close length tolerance of matched chain pairs
- Long chain strands to suit clients requirements

Machining

HEKO have for many years manufactured chains and chain wheels to different dimensions and arrangements. The many variations virtually make every chain or chain wheel unique. HEKO's flexible manufacturing facilities enable easy adoption of customer's requirements for a particular order.

Modern CNC machining centres and automated lathes are utilised for machining of chain wheels, rollers of all types and shafts.

Heat treatment

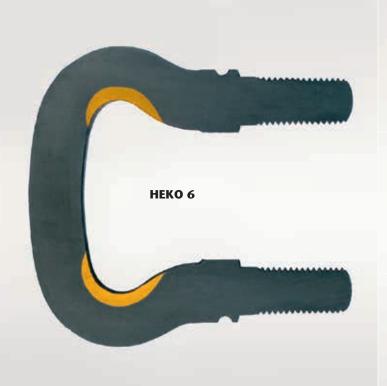

Heat treatment, considered the key technology in the manufacture of conveyor components, has been given a prominent place in HEKO since the 1930s. Different technologies are applied to achieved optimum wear resistance for particular requirements and material characteristics:

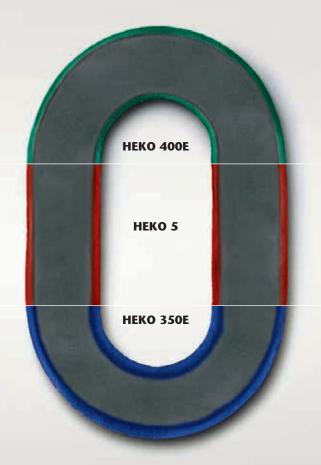

- Case hardening
- Induction hardening
- Tempered and quenched
- Nitriding

HEKO's use of vacuum chamber ovens with helium quenching is the leading technology for the manufacture of chain. The bespoke heat treatment facilities enable charges of up to 750 kg. Through such heat treatment HEKO's chain and accessories achieve special product characteristics:

- Highly wear resistant hardened case with a min. surface hardness of 800 HV
- High long term strength
- High breaking load due to fine-grained, tough core
- · Excellent dimensional accuracy

Overview of case hardening depth of HEKO's qualities

Technical characteristics for round link chain and attachments

HEKO's chains have benefited for decades from a special hardening technology which has since undergone further developments by HEKO. High wear resistance is nowadays achieved by the most up-to-date technology. Vacuum chamber ovens with helium quenching produces high quality case hardened product and is considered to be the technological leader for the manufacture of chains.

Technological characteristics of HEKO chain qualities

	case hardened qu	ualities CrNi-steels/0	CrNiMo steels
	HEKO 400E	НЕКО 5	HEKO 350E
proof stress N/mm²	240	150	210
breaking stress N/mm²	400 ₁₎	370 ₆₎	350 ₁₎
surface hardness min. Inside lin HV1	800	800	800
case hardening depth d+/-0.01d after etching	0,09	0,10	0,14 ₂₎
case hardening depth d min. CHD 550 _{s)}	0,05	0,06 ₃₎	0,09 ₄₎

- 1) 10 % tolerance
- 2) 30 mm \emptyset = 0,12 d, 36-42 mm \emptyset = 0,11 d
- $3) \ge 30 \text{ mm } \emptyset = 0.05 \text{ d}$

- 4) 30 mm \emptyset = 0,08 d, 36-42 mm \emptyset = 0,07 d
- 5) CHD = case hardening depth
- 6) \geq 30 mm Ø = 20 % tolerance

HEKO's TS shackles match the material grade and hardening depths of the respective chain quality. Different induction and case hardening methods are available to meet the required wear resistance.

Technical characteristics of HEKO's TS shackles, SMO scraper attachments and HF/HR chain locks

	contact surface I	hardened quality	case hardened
	MnCr-steel	CrMo-steel	
	HEKO 5S	HEKO 6	HEKO 6S

Further dimensions and qualities on request

HEKO steel idling wheels, type GUE and VUE

HEKO steel chain wheels, toothless, type GUE I

HEKO steel idling wheels, type **GUE** and **VUE**

- Suitable for changing chain direction
- Large cleaning openings
- Supplied with or without outside guide disc
- For all chain dimensions
- Small wheels turned from one piece (VUE)
- otherwise welded construction (GUE)
- Suitable for HEKO system TS and SMO and some bespoke attachments
- Rim surface hardened for long service life

HEKO steel idling wheels type VUE

HEKO steel idling wheels type GUE and VUE

HEKO scraper

HEKO scraper assembly with TS

HEKO scraper assembly with SMO

HEKO bespoke scraper assembly

HEKO scraper

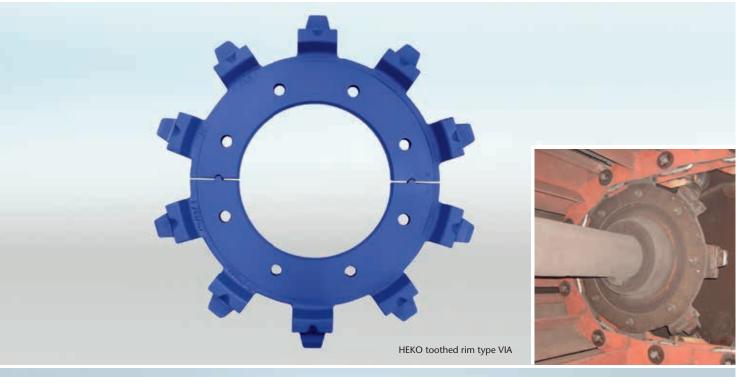

- Scrapers can be manufactured to suit client's requirements
- Depending on application scrapers can also be manufactured re-enforced
- Wear strips from HARDOX
- Box construction can also be supplied
- Scraper width up to 3000 mm
- Sacreficial anodes can be fitted for corrosive applications
- Furnished in different material qualities

Required data for preparing a quotation Profile type 1 2 3 4

Scraper dimensions

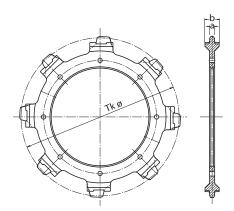

corresponding chain	scraper attachment		dimensions in mm			profile

KMA = chain centres, dimensioned drawings are required for bespoke designs

Coal feeder

HEKO toothed rim type VIA

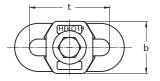

HEKO coal feeder

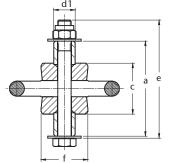

- Scrapers and other components can be manufactured to suit client requirements
- Suitable chain wheels can be supplied solid or with replaceable parts
- Different chain locks can by supplied
- Compact cleaning scrapers can be supplied for small chain pitches
- Many different attachments for scrapers are available

Dimensions and qualities

dimensions in mm

14 x 64	WN	3,7	16,3	47,0	123	114	108
16 x 64	WN	5,1	20,0	55,0	160	148	140
19 x 120	WN	6,3	23,0	64,5	227	210	198

Other dimensions and qualities on request, WN = works standard; MBK = Min. breaking load

HEKO chain lock type HV

HEKO chain lock type HV

corresponding chain	dimensio		type					
nominal thickness x Pitch							weight	
d x t (mm)	b	С	f	a	d1	e	kg/each	
14 x 50	47	15					0,25	HR
14 x 64	47	15					0,30	HR
16 x 64	56	17,5					0,50	HR
19 x 120	70	67	61	133	ø 32	160	2,50	HV

Dimension to suit HEKO drawings, HR = space saving arrangement; HV = cuboide arrangement

Deasher maintenance

Regular inspection and maintenance of wet desashers ensures that the chain system achieves its optimum service life.

Chain Tension:

Generally, chain tension should be kept at minimum, which will vary from plant to plant. This can be established by viewing the idling wheel in the lower trough inside the horizontal section. The idling wheel and chain should just be in contact, sufficient to turn the idling wheel. Chain tension can be adjusted by the tensioning unit. Once the tension travel has been used up, the chain must be shortened. If the product is not conveyed symetrically additional, one sided wear will result. This may sometimes be adjusted by increasing the tension on the shorter chain. If this is not successfull, exchanging a chain length on the right with one on the left may correct the overall chain length. However, the best solution is to correct the flow of ash and centralise it into the centre of the deasher, which may not always be achievable.

Shortening:

Both chains should be shortened at the same position, right and left. With endless chains, open the chain locks and remove 2, 4, or 6 links, ideally with a side cutter to avoid softening adjacent chain links. If an oxy-acetylene cutter or similar has to be used, ensure that none of the chain links still left in service are not heated above 150°C as this will damage the chain. Once shortened refit the chain locks to both chains.

Water flushing of chain:

Most wet deashers are fitted with water flushing of the chains, just in front of the drive chain wheels. Regular checks should be carried out to ensure that ash is effectively removed from the chain before it reaches the drive wheels to minimise both chain and tooth wear. Clean, fresh water should be used for flushing to minimise corrosion.

Conveying speed:

The speed of the scraper should be adjusted to suit the ash conveying rate. The best speed should be that the product just spills over the scraper at the end of the dewatering section (coming out of the water bath). Excessive speed not only reduces dewatering but also increases wear.

Chain wear:

As the chain runs through an abrasive material, wear is quite normal. Chains should be removed once their service life has been reached, e. g., once the minimum breaking load is reached. This point is reached for chain quality 400E when the chain pitch has increased by 5 % and with chain quality 350E by 7 %. At this wear level the breaking load is hardly affected as the hardened case has very little influence on the breaking load, it only provides resistance to wear.

Meshing problem often occur by chain wear in excess of 2 %. If this becomes a problem, it can be corrected by fitting replaceable rims with teeth to suit the adjusted pitch or, by adjustable teeth, if fitted.

Submerged Idling wheels:

HEKO's submerged idling wheels incorporate an extensive sealing system to protect bearings against the ingress of water and ash. Regular re-greasing is essential to protect the seals. Both the type and quantity of grease can be obtained from the OEM's operating and maintenance manuel.

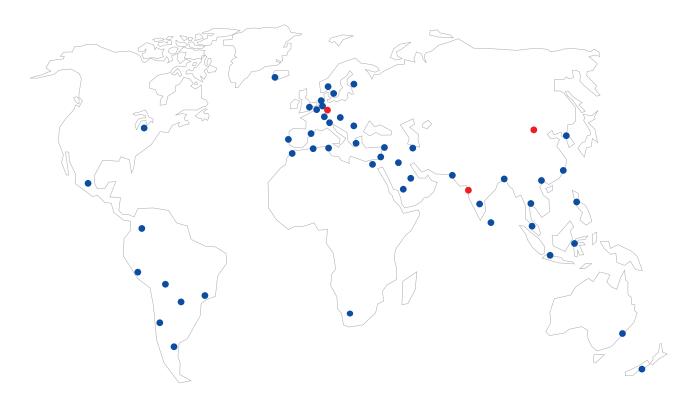

HEKO idling wheels should be re-greased with approx. 80 gr of grease every 14 days

Idling wheels can be fitted with rotation monitors. Those without should be regularly checked manually. If the wheels no longer rotate freely they should be replaced or repaired immediately to prevent damage to the chains.

Scrapers:

Damaged, distorted scrapers must be replaced, otherwise damage will result in misalignment, causing damage to the chain wheels and other internal components.

HEKO is represented through agents and business partners in over 50 countries around the globe.
